

# The Good Neighbor Program Marcellus Asset

GOOD NEIGHBOR

Our Good Neighbor Program focuses primarily on the impact our activities may have in the areas of environment, community, roads, traffic, noise and well pad maintenance.

## Our Commitments

### Environment

- Position multiple wells and compressors on one pad to minimize our environmental footprint
- Conduct daily inspections on operating sites that contain tanks, flares and compressors to prevent release into the air, ground or water
- Ensure sustainable use of water through monitoring and regulatory compliance, and strive to reuse flowback and produced water where possible
- Take measures to control dust where necessary
- Use lean-burning compression engines to ensure emissions are minimized when possible
- Take a preferential approach to fresh water movement through surface and buried lines over trucking where logistically and economically feasible
- Be transparent and disclose hydraulic fracturing chemicals, for all of our U.S. wells by location, through FracFocus.org
- Proactively engage environmental nonprofit organizations to support local wildlife conservations efforts in our operating areas

### Community

- Maintain a comprehensive emergency response program in all operating areas
- Strengthen our long-standing commitment to support local communities where we operate and live
- Actively engage, participate and volunteer in community initiatives
- Support local community organizations that qualify for Repsol funding [visit <https://repsol.us/en/sustainability/community-investment/index.cshtml> for more details]

## Roads

- Post appropriate road signage prior to the movement of rigs or heavy equipment
- Ensure flag people or escort vehicles are available in areas of reduced visibility to help manage traffic during rig moves
- Avoid moving rigs and heavy equipment during school bus travel times, when possible
- Monitor and maintain all lease roads
- Conduct regular safety meetings to review road safety with our contractors
- Repair and, where practical, improve roads if operations cause damage, obtaining the required approvals as necessary

## Traffic

- Follow all posted speed limits and reduce speed when conditions require
- Post signage to alert drivers to industrial traffic
- Coordinate one-way traffic on congested roads, where practical
- Strive to restrict truck traffic in school zones during peak times
- Work with communities to avoid large-scale activity on county roads during special community events and high traffic times
- Have a security officer spot monitor traffic in operating areas to ensure compliance

## Noise

- Strategically place equipment to mitigate noise, use mufflers, low-speed fans and noise attenuated coolers
- Ensure truck drivers limit the use of retarder/ jake brakes within town limits or in close proximity to residences, when safe to do so

## Well Pad Maintenance

- Install gated entrances to ensure security of facilities and control access to property
- Use spill containment to protect soil and ground water
- Support good housekeeping practices around all well pad locations
